OUR HISTORY

Munro built its first prefabricated municipal pumping station in 1970. Although pump, pipe and valve technology has seen only discreet changes, the technology that drives how the pumps are controlled has changed dramatically! Munro has been on the cutting edge of those changes through the use of Variable Frequency Drives and Programmable Logic Controllers long before it became the industry standard.

OUR QUALITY

All completed Munro electrical panels are listed with the Underwriters Laboratory to insure that our products are as safe as possible. With Munro's innovative product line we can offer stations with unprecedented reliability and performance.

OUR SERVICE

Munro provides custom systems, designed, built, tested and serviced with a personal commitment to solving customer needs. Each system is designed and coordinated according to individual customer requirements, ensuring all needs and budget guidelines are met.

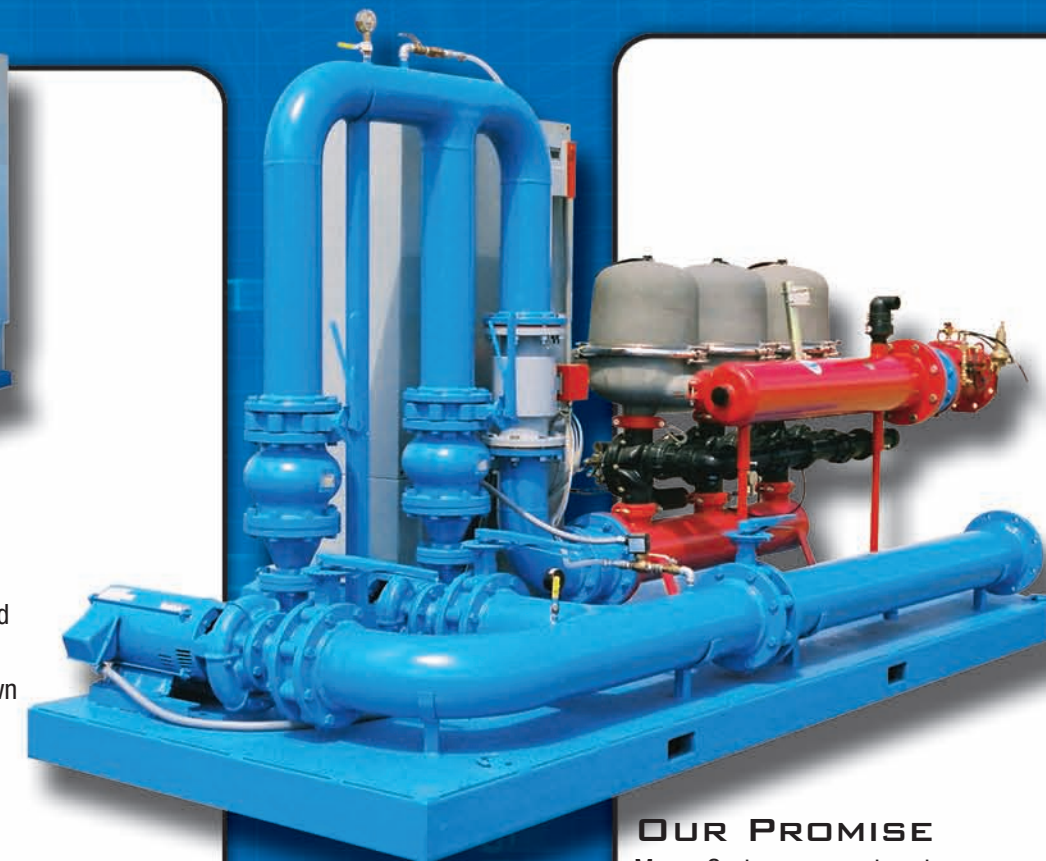

OUR PRODUCTS

All components of Munro stations meet rigid standards of excellence and reliability that exceed industry regulations. All stations are wired, piped hydraulically, and tested electrically against known quality guidelines prior to shipment. Attention to detail and quality control in assembly insures a smooth start up for all Munro stations.

OUR PEOPLE

Munro's design approach has impressed engineers and industrial professionals around the world. Some of our control concepts have caused long time professionals to change their thinking about long-standing designs. Munro looks at new technology and design methods to offer greater station reliability and significant cost savings.

OUR PROMISE

Munro Systems guarantees to our customers, we will continue to use the most innovative products on the market to meet your station needs.
